The NIAC03 Analog Input Calibration Module is required to calibrate the IMASM03 Analog Slave Module (100 ohm resistance temperature detector (RTD)). Calibration resistances are read from the NIAC03 module through the IMASM03 slave module. Calibration values are read across the slave expander bus and processed by the IMAMM03 master module.

This manual explains the purpose, setup, handling precautions and steps to install the NIAC03 module. Calibrate the slave according to the IMAMM03 product instruction. Refer to the table of contents to find the information. Refer to the HOW TO USE THIS MANUAL entry in this section to get started.

**INTENDED USER**

System engineers and technicians should read this manual before installing and using the termination module. Put the module into operation only after reading and understanding this instruction.

**MODULE DESCRIPTION**

The NIAC03 module is a single printed circuit board that uses one slot in a NTMU01 or NTMU02 Termination Mounting Unit. The module has one card edge connector (P1) that connects to a slave module mounted in a dedicated calibration slot, through a cable. Jumpers on the NIAC03 module select one input at a time to be calibrated for zero or span.

**HARDWARE APPLICATION**

The NIAC03 module has on-board precision resistors on the termination module that are used to calibrate the zero and span of the slave inputs. The IMASM03 module must be physically moved to the dedicated calibration slot. The associated IMAMM03 module issues the calibration commands to the IMASM03 module. Figure 1-1 shows an application example for the NIAC03 module.

**FEATURES**

The design of the NIAC03 module, as with all INFI 90 devices, allows for flexibility in creating a process management system. Refer to the NOMENCLATURE entry of this section for the list
of devices that can be used with the calibration module in an INFI 90 system.

- A standard factory-wired cable connects the calibration module to the slave module.
- Each calibration module fits in a standard termination mounting unit.
- Resistance temperature detector input calibration for the 100 ohm RTD inputs on the IMASM03 module.
- Individual channel precision calibration resistors.
- Jumpers select correct resistance for zero or span calibration for each channel.

SECTION 2 - INSTALLATION

INTRODUCTION

This section explains how to install the NIAC03 Analog Input Calibration Module. Read, understand, and complete the steps in the order they appear before using the NIAC03 module.

SPECIAL HANDLING

Observe these steps when handling electronic circuitry:

NOTE: Always use the Bailey Controls Field Static Kit (part number 1948385A1 - consisting of two wrist straps, ground cord assembly, alligator clip, and static dissipating work surface) when working with modules. The kit is designed to connect the technician and the static dissipating work surface to the same ground point to prevent damage to the modules by electrostatic discharge.

Use the static grounding wrist strap when installing and removing modules. Static discharge may damage MOS devices on modules in the cabinet. Use grounded equipment and static safe practices when working with modules.

1. **Use Static Shielding Bag.** Keep the modules in static shielding bag until you are ready to install them in the system. Save the bag for future use.

2. **Ground Bags Before Opening.** Before opening a bag containing an assembly with CMOS devices, touch it to the equipment housing or ground to equalize charges.

3. **Avoid Touching Circuitry.** Handle assemblies by the edges; avoid touching the circuitry.

4. **Avoid Partial Connection of CMOS Device.** Verify that all devices connected to the modules are properly grounded before using them.

5. **Ground Test Equipment.**

6. **Use an Antistatic Field Service Vacuum.** Remove dust from the module if necessary.

7. **Use a Grounded Wrist Strap.** Connect the wrist strap to the appropriate grounding plug on the power entry panel. The grounding plug on the power entry panel is connected to the cabinet chassis ground.

8. **Do Not Use Lead Pencils to Set Dipswitches.** To avoid contamination of switch contacts that can result in circuit board malfunction, do not use a lead pencil to set a dipswitch.
UNPACKING AND INSPECTION

These are steps to follow for general handling:

1. Examine the module to make sure that no damage has occurred in transit.

2. Notify the nearest Bailey Controls sales office of any damage.

3. File a claim for any damage with the shipping company that handled the shipment.

4. Use the original packing material or container to store the module.

5. Store the module in a place with clean air; free of extremes of temperature and humidity.

SETUP/PHYSICAL INSTALLATION

This section explains how to configure and install the NIAC03 module. The required procedures are installing the module into the TMU card rack and connecting the cable.

Jumper Settings

There are eight jumpers on the NIAC03 module, one for each input. Each jumper selects zero or span for its respective input. The IMAMM03 master module issues the calibration commands to the IMASM03 slave module being calibrated. To calibrate the zero, place the jumper over the lower and middle pins on the input being calibrated. To calibrate the span, place the jumper over the upper and middle pins on the input being calibrated. Zero and span must be calibrated separately for each input. Refer to the IMAMM03 module product instruction for calibration instructions. Figure 2-1 shows the calibration jumper locations on the NIAC03 circuit board.

Cable Installation

The NKTU02, NKTU12, or NKTM01 cable connects the NIAC03 module to the IMASM03 module. The NKTM01 cable is a flat ribbon cable. The NKTU02 cable is a round, shielded cable with PVC jacket. The NKTU12 module is a round, shielded cable with non-PVC jacket.

Figure 2-2 shows the cabling from the NIAC03 module to the IMASM03 module. Table 2-1 lists the NIAC03 module cable connections.
Figure 2-1. NIAC03 Module Jumper Locations

Figure 2-2. Cable Connections for the NIAC03 Module
To install the cable to an IMASM03 slave module, follow these steps.

### CAUTION

Remove modules from their module mounting unit slots before installing or removing a cable assigned to that slot. Failure to do so could result in damage to the module.

### ATTENTION

Retirer le module de son emplacement dans le chasssis de montage des modules avant d'installer ou de retirer un cable assigne a cet emplacement. Un manquement a cette procedure pourrait endommager le module.

1. If round type cables are already installed in the TMU card rack, remove the cable retaining bracket (Bailey Controls part number 258436_1). Use NKTU02, NKTU12 or NKTM01 cables.

2. Insert the J2 end of the cable into the multibus module mounting unit backplane slot assigned to calibrate slave modules. The cable should latch securely in place. Card edge connector P3 of the slave module to be calibrated will connect to this end of the cable.

   **NOTE:** Locate the slave calibration slot as close as possible to the master module.

3. If NKTU02 or NKTU12 cables are used, connect the shield wire extending from the J2 end of the cable to the shield bar.

4. Insert the J1 end of the cable into the TMU backplane slot assigned to the NIAC03 module. The cable should latch securely in place. Card edge connector P1 of the NIAC03 module connects to this end of the cable.

5. Replace or add the cable retaining bracket if round type cables are installed in the TMU card rack.

Module Installation

The NIAC03 module inserts into a standard INFI 90 system termination mounting unit (TMU) and occupies one slot. To install:

1. Verify slot assignment of the NIAC03 module.

2. Align the NIAC03 module with the guide rails in the TMU card rack and insert the module.

The NIAC03 module is ready for operation if:

1. Jumpers for each channel are set for zero or span.

2. The circuit board is mounted in the termination mounting unit.

3. The required cable is connected to the calibration module.
**SECTION 3 - MAINTENANCE**
